

Key learnings from the video

Learnt about various software development testing techniques and basics. Includes SDLC, STLC, QA vs QC, Static and Dynamic Testing, V-Model and so on. The SDLC phase defines each and every stages(8) to go through before handing out to the clients. The same goes for STLC. It is a testing lifecycle. QA is a proactive method whereas QC is a reactive method. It focuses more on damage control rather than prevention. Static Testing ensures the test is done without running the program, whereas, dynamic testing is done at the time of operation. It's an ongoing technique. V-model includes two primary sections, i.e. Verification and Validation. Verification includes review, BRS, HLD, LLD, SRS whereas, Validation includes things like white-box and black-box testing.
