

Localization

Localization Testing is a testing that is performed to verify the quality of a product for a specific culture or region. Localization testing is performed only on the local version of the product. It ensures that a product is properly adapted for a specific region, focusing not only on translating the language but also on cultural, regional, and legal aspects that affect user experience.

Features:

- **Localized user interface:** It tests the user interface is affected by local.
- **Localized content:** Different contents that are in-built in the application are according to the local culture and the test is performed to check whether it is comfortable for locals.
- **Specific Language:** A test is performed to check the language supported by the application to know the software's compatibility with the language of the specific region.
- **Hardware Compatibility:** Hardware compatibility test is performed to test the compatibility of the software and the hardware toward the specific region.

Internationalization

Internationalization testing is a process to ensure the adaptability of software to different cultures and languages around the world without any modifications in source code. It is also shortly known as i18n, in which 18 represents the number of characters in between I & N in the word Internationalization. Internationalization makes applications ready for localization.

Why it's important:

- To ensure the proper encoding of characters when a language is converted to another language.

- To check, if the search query or string is not supported with the targeted language then the software will not crash or malfunction.
- To attract audiences globally by providing convenience in using the application in their preferred languages.
- To make sure that the look and feel of the font and font size are rendered accordingly.

Globalization

Globalization Testing is a process of validating whether a website delivers a customized user experience to users across the globe. It is used to test the software for multiple languages and improve the application for various languages. It ensures that the application can be used all over the world and accepts all language texts. Nowadays with the increase in various technologies, every software product is designed in such a way that it is a globalized software product.

Globalization (G11N)	Internationalization (I18N)	Localization (L10N)
The overall strategy of designing and developing a product that can easily be adapted to various languages, regions, and cultures.	The <i>technical process</i> of making software ready for localization. Focuses on code-level flexibility.	The <i>adaptation</i> of a product for a specific language, region, or culture.
