

Test Plan

Test plan is a document that states the future testing activities. It defines work products and how they will be tested. Here, the test manager prepares test plan. Test plan works as the blueprint that changes as the project progress through. It is shared with many stakeholders like Project Manager, Project members, developers and many associated with the project.

Importance of Test Strategy and Planning

Test Strategy is an approach that defines to create a test plan. It's main goal is to define scope and coverage of testing. Test plan has clear definitions of test cases and schedules whereas, test strategy includes test methods and objectives. Test plan is specific and detailed document whereas, test strategy is much broader and high level.

Importances (Test Strategy):

- Defines goals and scope. It sets a clear path and a roadmap
- Allocates resources, implement testing methods, set priorities
- Ensures quality goals like sustainability, reliability, etc
- Defines responsibilities and roles
- Manages risks
- Defines business objectives and the project meets the demands or not

Importances (Test Plan):

- Defines scope of testing like what features will be tested, what should be taken out and what should be considered
- Defines schedules. Sets timeline for the execution
- Helps to measure testing progress

- Updates people about the testing process. Reduces communication overhead between each other

Entry / Exit Criteria

Entry criteria in testing is the requirements to be met before entering the STLC phase. Exit criteria defines conditions to be fulfilled and all objectives are met before the closing phase and moving to another.

Entry Criteria for STLC

- Requirement Analysis: Requirements are properly documented, scope is defined.
- Test Planning: Test Strategy is outlined, resources are allocated.
- Test Case Design and Development: Approved test plan. Test data is ready.
- Test Environment Setup: Test setup is defined.
- Test Execution: Environment is validated, test cases are finalized.
- Test Closure: Execution is complete , no defects.

Exit Criteria for STLC

- Requirement Analysis: Requirements are documented, mapped in the Requirement Traceability Matrix (RTM).
- Test Planning: Test plan is finalized, tools and resources are set up.
- Test Case Design & Development: Test cases and automation scripts are reviewed, and approved.
- Test Environment Setup: Environment is configured and validated.
- Test Execution: All test cases are executed, defects are resolved.

- Test Closure: Testing is completed, defects are accepted, and lessons learned are documented.
